

Radar for Security & Audit

If you experienced an attack on your Office 365 environment, how quickly could you respond?

Do you have an audit trail where you can filter your data to investigate an event and report rapidly on suspicious activity?

How long would it take you to investigate a security incident, identify the cause, and take action?

Radar for Security & Audit enables you to see exactly what's happening in your Office 365 environment: every file modified, every login attempt, every password change, every mailbox accessed - including when, where from, and who by.

Unlike the native Office 365 Audit Log - which gives you all your activity in one, large, unwieldy view, Radar for Security & Audit enables you to segment and visualize activity, so that you can isolate events or threats quickly using advanced search capabilities.

Too much information can be just as bad as too little.

Your employees perform millions of actions on Office 365 every day. When an incident occurs and you're tasked with finding out what happened, who was responsible, and what action needs to be taken - how do you find the needle in the haystack?

Without the right tools to investigate, you may not have the information you need to respond for hours or days. All the while, your Office 365 environment remains compromised and vulnerable to further attacks. Can you afford to wait?

How much could a security incident cost you?

A data breach or security incident has a very real cost. Whether it's legal action, regulatory fines - all it takes is a quick search to see the direct financial cost of security breaches. What about the impact on trust for your existing customers? Damage to your company's reputation can be equally harmful, and often more challenging to regain.

Use Radar for Security & Audit to:

- › Detect and investigate suspicious activity in Office 365 - Has something happened to an important document in SharePoint Online? Respond quickly by seeing who viewed, modified, or deleted it.
- › Identify external attacks on your environment, such as brute force password attacks or user credential leaks.
- › Produce an audit log of activity in Office 365 for a particular user, or timeframe.
- › Validate that security policies are working effectively, and create new policies based on understanding actual activity and vulnerabilities.

Investigate suspicious activities

Organizations today face the constant threat of increasingly intelligent malware and targeted hacking campaigns – not to mention the threats from within – be they careless or malicious. Radar for Security & Audit collects records of all user activity, so you can detect unusual behavior, monitor specific users, and, when necessary, take action to protect your environment.

Alerting!

We have now introduced on-event alerting to Radar for Security & Audit. This means that you can investigate suspicious activity, and potential threats in real-time. With alerting, you can:

- › Create custom alerts for events you need to see.
- › Investigate potential threats quickly, and prevent security incidents before they occur. Set up email notifications or Mobile SMS alerts for the activities you want to monitor!

Keep an eye on admin activities

Stay on top of your environment and its configurations by reviewing Admin activities with advanced filtering to isolate user or activity details. Regular Admin reviews can be used to find and remove inactive Admins, or those who have left or changed roles, but not had their permissions revoked.

External threat detection

Identify external attacks on your environment, such as brute force attacks or user credential leaks by monitoring anomalous events, including failed password attempts, suspicious user locations, and irregular sign-in activity for everyone that tries to access your Office 365 environment.

Simple to set up, secure, trusted, and highly customizable.

Need reporting on key adoption metrics, licensing or storage and permissions settings across your Office 365 workloads? Find out more about our other reporting modules: **Radar for Office 365**, and **Radar for SharePoint Online**.
